

SaaS Customer Support Workflow Improvement

Business Analysis Portfolio Case Study

Portfolio note: SupportFlow is fictional. All volumes, KPI values and scenarios are illustrative assumptions.

1. Background

SupportFlow is a fictional SaaS platform for managing customer support tickets, categorization, assignment, SLA tracking, escalations and resolution.

2. Business Problem

Manual categorization, routing and escalation can create routing errors, resolution delays, SLA risks, repeated customer interactions and weak visibility into recurring issues.

3. Objective

Analyze the As-Is workflow, identify pain points and gaps, define requirements, design a To-Be workflow, and establish UAT and KPI measures.

4. Stakeholders

Customers, Support Agents, Support Managers, Product Managers, Engineering and Operations/Leadership.

5. As-Is Analysis

Customer raises ticket → Support receives → Manual categorization → Manual assignment → Investigation → Escalation → Engineering → Resolution → Customer notification.

6. Key Gaps

Manual classification, incomplete ticket context, wrong-team routing, weak SLA escalation visibility, inconsistent engineering handoff and limited recurring-issue reporting.

7. Requirements

Mandatory ticket information, controlled taxonomy, rule-based routing, SLA visibility and escalation, standardized Engineering handoff, and reporting fields.

8. To-Be Workflow

Customer raises ticket → Mandatory information validation → Categorization → Rule-based routing → SLA monitoring → Investigation → Escalation when needed → Standard Engineering handoff → Resolution → Reporting.

9. User Stories

The backlog includes stories for categorization, routing, mandatory information, SLA visibility, engineering handoff and support reporting.

10. UAT

Seven representative scenarios validate categorization, routing, required fields, SLA visibility, escalation, Engineering handoff and reporting.

11. KPI Framework

First response time, average resolution time, SLA compliance, escalation rate, first contact resolution, repetitive query rate and wrong routing rate.

12. Expected Impact

The proposed workflow is intended to improve process consistency, visibility and handoff quality. Quantitative targets must be validated using real baseline data before implementation.
